

What is FEDORA?

FEDORA is a Horizon Europe project working on better multimodal transport management. It brings together data spaces, optimisation services and simulation tools to help mobility actors understand what is happening, respond faster and plan smarter across complex transport networks.

Rather than testing ideas in isolation, FEDORA validates them in six pilot sites across Europe, each reflecting different mobility realities and operational needs.

Where FEDORA is being tested?

- Vienna
- Basque Country
- Nicosia
- Copenhagen
- Reggio Emilia
- Budapest

What FEDORA brings to the table

- Smarter use of transport data
- Better coordination across modes and actors
- Tools for anticipation, response and planning
- User-aware and operationally relevant solutions

**One connected approach to making transport systems think, adapt, and respond.
Scan the network. Test the response. Rethink the flow.**
